Week-2

Mathematics for Data Science - 2 Continuity and Differentiability Activity Slides

- 1. Consider a function $f: \mathbb{R} \to \mathbb{R}$ such that f(cx) = cf(x) for all $c, x \in \mathbb{R}$. Which of the following option(s) is(are) correct?
 - \bigcirc Option 1: f(x+y) = f(x) + f(y) for all $x, y \in \mathbb{R}$.
 - \bigcirc Option 2: f is not continuous in \mathbb{R} .
 - \bigcirc Option 3: f is continuous in \mathbb{R} .
 - \bigcirc Option 4: $\lim_{x\to a} f(x)$ exists for all $a\in R$, but f is not continuous in \mathbb{R} .

Hint:

•
$$f(cx) = cf(x)$$
 for all $c, x \in \mathbb{R} \implies f(x) = xf(1)$

Solution:

Step 1:

$$f(x+y) = (x+y)f(1) = xf(1) + yf(1) = f(x) + f(y)$$

Step 2:

Let $a \in \mathbb{R}$, and consider a sequence $\{x_n\}$ such that $x_n \to a$.

$$\lim_{n \to \infty} f(x_n) = \lim_{n \to \infty} x_n f(1) = f(1) \lim_{n \to \infty} x_n = f(1)a = f(a)$$

Option 1 and 3 are correct.

2. Define a function f as follows:

$$f(x) = \begin{cases} \frac{1}{e^{\frac{1}{x}} + 1} & \text{if } x \neq 0, \\ 0 & \text{if } x = 0 \end{cases}$$

Which of the following option(s) is(are) true?

- $\bigcirc \text{ Option 1: } \lim_{x \to 0^-} f(x) \neq \lim_{x \to 0^+} f(x)$
- $\bigcirc \text{ Option 2: } \lim_{x \to 0^-} f(x) = \lim_{x \to 0^+} f(x)$
- \bigcirc Option 3: f is a bounded function on \mathbb{R} .
- \bigcirc Option 4: f is continuous at x = 0.

Solution:

Step 1:
$$e^{\frac{1}{x}} > 0 \implies e^{\frac{1}{x}} + 1 > 1 \implies 1 > \frac{1}{e^{\frac{1}{x}} + 1} > 0$$

Step 2: Left hand limit

Consider a sequence $\{x_n\}$ such that $x_n < 0$ and $x_n \to 0$.

$$\frac{1}{x_n} \to -\infty \implies e^{\frac{1}{x_n}} \to 0 \implies e^{\frac{1}{x_n}} + 1 \to 1 \implies \frac{1}{e^{\frac{1}{x_n}} + 1} \to 1$$

Step 3: Right hand limit

Consider a sequence $\{x_n\}$ such that $x_n > 0$ and $x_n \to 0$.

$$\frac{1}{x_n} \to \infty \implies e^{\frac{1}{x_n}} \to \infty \implies e^{\frac{1}{x_n}} + 1 \to \infty \implies \frac{1}{e^{\frac{1}{x_n}} + 1} \to 0$$

 $LHL \neq RHL$

- 3. Which of the following options showing step wise solution to check whether a function is differentiable or not are true?
 - Option 1: Checking whether a constant function f(x) = c is differentiable at any real number a or not: $\lim_{h\to 0} \frac{f(a+h)-f(a)}{h} = \lim_{h\to 0} \frac{c+h-c}{h} = \lim_{h\to 0} \frac{h}{h} = 1$.
 - Option 2: Checking whether f(x) = x c is differentiable at a for some real number a, or not: $\lim_{h\to 0} \frac{f(a+h)-f(a)}{h} = \lim_{h\to 0} \frac{(a+h-c)-(a-c)}{h} = \lim_{h\to 0} \frac{h}{h} = 1$.
 - Option 3: Checking whether $f(x)=x^2$ is differentiable at any real number a or not: $\lim_{h\to 0}\frac{f(a+h)-f(a)}{h}=\lim_{h\to 0}\frac{(a+h)^2-a^2}{h}=\lim_{h\to 0}\frac{2ah+h^2}{h}=0$
 - Option 4: Checking whether $f(x) = e^x$ is differentiable at any real number a or not: $\lim_{h\to 0} \frac{f(a+h)-f(a)}{h} = \lim_{h\to 0} \frac{e^{a+h}-e^a}{h} = \lim_{h\to 0} \frac{e^a(e^h-1)}{h} = e^a \lim_{h\to 0} \frac{e^h-1}{h} = e^a.1 = e^a.$

Solution:

• if f(x) = c, then f(a + h) = f(a) = c. So, option 1 is wrong.

• if
$$f(x) = x^2$$
, then $f(a+h) - f(a) = (a+h)^2 - a^2 = 2ah + h^2$.

$$\lim_{h \to 0} \frac{2ah + h^2}{h} = \lim_{h \to 0} h \times \frac{2a + h}{h} = \lim_{h \to 0} 2a + h = 2a$$
. So, option 3 is wrong.

- 4. Consider the function $f(x) = |\sin x|$. Then f is
 - \bigcirc Option 1: periodic with period π .
 - Option 2: everywhere continuous and differentiable.
 - \bigcirc Option 3: everywhere continuous and not differentiable at $n\pi$, where $n \in \mathbb{Z}$.
 - \bigcirc Option 4: neither continuous nor differentiable at $n\pi$, where $n \in \mathbb{Z}$.

[**Hint:** Try to draw the graph of $|\sin x|$]

Solution:

Step 1:

$$\sin(x+y) = \sin(x)\cos(y) + \sin(y)\cos(x)$$

$$\sin(x+\pi) = \sin(x)\cos(\pi) + \sin(\pi)\cos(x) = -\sin(x) \implies |\sin(x+\pi)| = |\sin(x)|$$

f is periodic with period π .

Step 2:

$$|\sin(x)| = |x| \circ \sin(x)$$
 (composition)

So, $|\sin(x)|$ is continuous and differentiable on $\mathbb{R}/\{n\pi \mid n \in \mathbb{Z}\}$

Step 3:

Let $a \in \{n\pi \mid n \in \mathbb{Z}\},\$

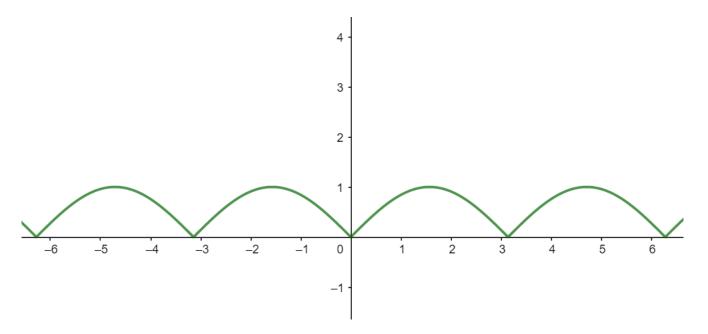

$$\lim_{x \to a} \frac{f(x) - f(a)}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} \times \frac{\sin(x) - \sin(a)}{\sin(x) - \sin(a)} = \lim_{x \to a} \frac{f(x) - f(a)}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(x)|}{x - a} = \lim_{x \to a$$

$$\lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{\sin(x) - \sin(a)} \times \frac{\sin(x) - \sin(a)}{x - a} = \lim_{x \to a} \frac{|\sin(x)| - |\sin(a)|}{\sin(x) - \sin(a)} \times \lim_{x \to a} \frac{\sin(x) - \sin(a)}{x - a}$$

$$= \lim_{x \to a} \frac{|\sin(x)|}{\sin(x)} \times \cos(a)$$

$$\lim_{x \to a} \frac{|\sin(x)|}{\sin(x)}$$
 does not exist.

Graph of $|\sin x|$:

At points $n\pi$, the graph has sharp "corners". At a sharp corner, there are many possible tangent lines. Hence, $|\sin x|$ is not differentiable on $\{n\pi \mid n\in \mathbb{Z}\}$.

5. If $f(x) = \sqrt{9-x^2}$, then find out the value of $\lim_{x\to 1} \frac{f(x)-f(1)}{x-1}$

 \bigcirc Option 1: $\frac{1}{\sqrt{8}}$

 \bigcirc Option 2: $-\frac{1}{\sqrt{8}}$

 \bigcirc Option 3: $\sqrt{8}$

Option 4: Does not exist

[**Hint:** Use L'Hospital's rule]

Solution:

Step 1:

$$\lim_{x \to 1} \frac{f(x) - f(1)}{x - 1} = \lim_{x \to 1} \frac{\sqrt{9 - x^2} - \sqrt{8}}{x - 1} = \lim_{x \to 1} \frac{-x}{\sqrt{9 - x^2}} = -\frac{1}{\sqrt{8}}$$

- 6. Let f and g be two distinct functions from \mathbb{R} to \mathbb{R} . Which of the following statements are true?
 - \bigcirc Option 1: If fg is differentiable, then both f and g are differentiable.
 - Option 2: Assume that $g(x) \neq 0$ for all $x \in \mathbb{R}$. If $\frac{f}{g}$ is differentiable, then both f and g are differentiable.
 - \bigcirc Option 3: If f is an even differentiable function, then f' is an odd function.
 - \bigcirc Option 4: If f is an odd differentiable function then, f' is an even function.

Solution:

Step 1: Consider two functions
$$f(x) = \begin{cases} 1 & \text{if } x \ge 0 \\ 0 & \text{if } x < 0 \end{cases}$$
, $g(x) = \begin{cases} 0 & \text{if } x \ge 0 \\ 1 & \text{if } x < 0 \end{cases}$.

Step 2: Consider two functions
$$f(x) = \begin{cases} 4 & \text{if } x \ge 0 \\ 6 & \text{if } x < 0 \end{cases}$$
, $g(x) = \begin{cases} 2 & \text{if } x \ge 0 \\ 3 & \text{if } x < 0 \end{cases}$.

Step 3: A function f is said to be even iff f(x) = f(-x).

Differentiate both sides,

$$f'(x) = f'(-x) \cdot \frac{d}{dx}(-x)$$

$$\implies f'(x) = f'(-x) \cdot (-1)$$

$$\implies f'(x) = -f'(-x)$$

$$\implies f'(-x) = -f'(x)$$

Step 4: A function f is said to be odd iff f(-x) = -f(x).

Differentiate both sides,

$$f'(-x) \cdot \frac{d}{dx}(-x) = -f'(x)$$

$$\implies f'(-x) \cdot (-1) = -f'(x)$$

$$\implies -f'(-x) = -f'(x)$$

$$\implies f'(-x) = f'(x)$$

7. Let f be a differentiable function at $x = 1$. The tangent line to the curve represented by the function f at the point $(1,0)$ passes through the point $(5,8)$. What will be the value of $f'(1)$?
Option 1: 1
Option 2: 2
Option 3: 3
Option 4: 4
Solution:
Step:1
f'(1) is equal to the slope of the line which passes through $(1,0)$ and $(5,8)$.
